

Lecture 2:-

Env Setup, First look at Data / Visualization

Working Environment :-

Virtual env (environment) :-

Consider x as python and decimal number its version y, z and p are libraries. The problem is library or package such as y can be run in $x'1.8'$ only while p and z are accessible by only $x'1.7'$ but we want to use all y, z and p so we built different environment in one system. Therefore, we can use all package and different version is one system. This is called virtual environment which is known as Virtual env in python.

The virtual env is use ful when we want to ^{move} code it will move all packages which are needed for code which virtual machine is useful for execution.

Data Visualization:-

In data Visualization you visualize a large amount of data set into plots. To understand the trends and relationship between them.

The code is done in file name "00-nbnotes-data-basics.ipynb" in probability and Statistics folder.

We have done line and scatter plot in this file.
